But, just as we found that some garden flowers are grown only for their beauty, and do not set any seed, so we find that some fruits are grown specially without any seeds, such as bananas and some oranges. Such fruits are the result of our liking to eat the soft, sweet pulp without the trouble of the seeds, but such fruits are of no use to the plant. Now let us look at the structure of the ripe seeds Fig. 88. Strawberry. Each of the little seeds is a whole fruit, and the flesh the swollen receptacle. Fig. 89. (A) black A, outside of Bean scar showing where the bean was attached to the pod; (r) ridge made by young root; B, bean split open; (l) nurse leaves; (b) baby plant; (a) scar where the baby plant was separated from...

Good electronic book and valuable one. It is one of the most incredible publication we have read through. It is extremely difficult to leave it before concluding, once you begin to read the book.
